

# Capiphon draws water up by syphoning

The tank contains dyed water. Water begins to flow through the belt almost immediately even as the tank continues to fill.

# Capiphon draws water up by syphoning

The clock is reset to zero when the water level reaches the level of the exit slot.

CAPIPHON™

# Capiphon draws water up by syphoning

The water level continues to fall as the belt syphons water up from below the slot.

# Capiphon draws water up by syphoning

After about 20 minutes the water level in the tank has dropped to about -35mm. The belt is still dripping but only slowly.
